# Property Testing

## Definition

$f : \{0, 1\}^n \rightarrow \{0, 1\}$  is  $\epsilon$ -far from  $\mathcal{P}$  if, for any  $g : \{0, 1\}^n \rightarrow \{0, 1\}$  satisfying  $\mathcal{P}$ ,

$$\Pr_x[f(x) \neq g(x)] \geq \epsilon.$$

# Property Testing

## Definition

$f : \{0, 1\}^n \rightarrow \{0, 1\}$  is  $\epsilon$ -far from  $\mathcal{P}$  if, for any  $g : \{0, 1\}^n \rightarrow \{0, 1\}$  satisfying  $\mathcal{P}$ ,

$$\Pr_x[f(x) \neq g(x)] \geq \epsilon.$$

$\epsilon$ -tester for a property  $\mathcal{P}$ :

- Given  $f : \{0, 1\}^n \rightarrow \{0, 1\}$  as a query access.
- Proximity parameter  $\epsilon > 0$ .

Accept w.p. 2/3

Reject w.p. 2/3

# Local Testability

## Definition

$\mathcal{P}$  is *locally testable* if, for any  $\epsilon > 0$ , there is an  $\epsilon$ -tester with query complexity that only depends on  $\epsilon$ .

Examples of locally testable properties:

- Linearity:  $O(1/\epsilon)$  [BLR93]
- $d$ -degree Polynomials:  $O(2^d + 1/\epsilon)$  [AKK<sup>+</sup>05, BKS<sup>+</sup>10]
- Fourier sparsity [GOS<sup>+</sup>11]
- Odd-cycle-freeness:  $O(1/\epsilon^2)$  [BGRS12]  
 $\nexists$  odd  $k$  and  $x_1, \dots, x_k$  such that  $\sum_i x_i = 0$ ,  $f(x_i) = 1$  for all  $i$ .
- $k$ -Juntas:  $O(k/\epsilon + k \log k)$  [FKR<sup>+</sup>04, Bla09].

# Affine-Invariant Properties

## Definition

$\mathcal{P}$  is *affine-invariant* if a function  $f : \mathbb{F}_2^n \rightarrow \{0, 1\}$  satisfies  $\mathcal{P}$ , then  $f \circ A$  satisfies  $\mathcal{P}$  for any bijective affine transformation  $A : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ .

Examples: Linearity, low-degree polynomials, Fourier sparsity, odd-cycle-freeness.

# Affine-Invariant Properties

## Definition

$\mathcal{P}$  is *affine-invariant* if a function  $f : \mathbb{F}_2^n \rightarrow \{0, 1\}$  satisfies  $\mathcal{P}$ , then  $f \circ A$  satisfies  $\mathcal{P}$  for any bijective affine transformation  $A : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ .

Examples: Linearity, low-degree polynomials, Fourier sparsity, odd-cycle-freeness.

Q. Characterization of locally testable affine-invariant properties? [KS08]

# Related Work

- Locally testable with one-sided error  $\Leftrightarrow$  affine-subspace hereditary? [BGS10]

Ex. Linearity, low-degree polynomials, odd-cycle-freeness.

- $\Rightarrow$  is true. [BGS10]
- $\Leftarrow$  is true (if the property has bounded complexity). [BFH<sup>+</sup>13].

# Graph Property Testing

## Definition

A graph  $G = (V, E)$  is  $\epsilon$ -*far* from a property  $\mathcal{P}$  if we must add or remove at least  $\epsilon|V|^2$  edges to make  $G$  satisfy  $\mathcal{P}$ .

Examples of locally testable properties:

- 3-Colorability [GGR98]
- $H$ -freeness [AFKS00]
- Monotone properties [AS08b]
- Hereditary properties [AS08a]

# A Characterization of Locally Testable Graph Properties

## Szemerédi's regularity lemma:

Every graph can be partitioned into a constant number of parts so that each pair of parts looks random.

# A Characterization of Locally Testable Graph Properties

Szemerédi's regularity lemma:

Every graph can be partitioned into a constant number of parts so that each pair of parts looks random.

Theorem ([AFNS09])

A graph property  $\mathcal{P}$  is locally testable

$\Leftrightarrow$  whether  $\mathcal{P}$  holds is determined only by the set of densities  $\{\eta_{ij}\}_{i,j}$ .

# A Characterization of Locally Testable Graph Properties

Szemerédi's regularity lemma:

Every graph can be partitioned into a constant number of parts so that each pair of parts looks random.

Theorem ([AFNS09])

A graph property  $\mathcal{P}$  is locally testable

$\Leftrightarrow$  whether  $\mathcal{P}$  holds is determined only by the set of densities  $\{\eta_{ij}\}_{i,j}$ .

Q. How can we extract such constant-size sketches from functions?

# Constant Sketch for Functions

## Theorem (Decomposition Theorem [BFH<sup>+</sup>13])

*For any  $\gamma > 0$ ,  $d \geq 1$ , and  $r : \mathbb{N} \rightarrow \mathbb{N}$ , there exists  $\overline{C}$  such that: any function  $f : \mathbb{F}_2^n \rightarrow \{0, 1\}$  can be decomposed as  $f = f' + f''$ , where*

# Constant Sketch for Functions

## Theorem (Decomposition Theorem [BFH<sup>+</sup>13])

*For any  $\gamma > 0$ ,  $d \geq 1$ , and  $r : \mathbb{N} \rightarrow \mathbb{N}$ , there exists  $\overline{C}$  such that: any function  $f : \mathbb{F}_2^n \rightarrow \{0, 1\}$  can be decomposed as  $f = f' + f''$ , where*

- *a **structured part**  $f' : \mathbb{F}_2^n \rightarrow [0, 1]$ , where*
  - *$f' = \Gamma(P_1, \dots, P_C)$  with  $C \leq \overline{C}$ ,*
  - *$P_1, \dots, P_C$  are “non-classical” polynomials of degree  $< d$  and rank  $\geq r(C)$ .*
  - *$\Gamma : \mathbb{T}^C \rightarrow [0, 1]$  is a function.*

# Constant Sketch for Functions

## Theorem (Decomposition Theorem [BFH<sup>+</sup>13])

For any  $\gamma > 0$ ,  $d \geq 1$ , and  $r : \mathbb{N} \rightarrow \mathbb{N}$ , there exists  $\overline{C}$  such that: any function  $f : \mathbb{F}_2^n \rightarrow \{0, 1\}$  can be decomposed as  $f = f' + f''$ , where

- a **structured part**  $f' : \mathbb{F}_2^n \rightarrow [0, 1]$ , where
  - $f' = \Gamma(P_1, \dots, P_C)$  with  $C \leq \overline{C}$ ,
  - $P_1, \dots, P_C$  are “non-classical” polynomials of degree  $< d$  and rank  $\geq r(C)$ .
  - $\Gamma : \mathbb{T}^C \rightarrow [0, 1]$  is a function.
- a **pseudo-random part**  $f'' : \mathbb{F}_2^n \rightarrow [-1, 1]$ 
  - The Gowers norm  $\|f''\|_{U^d}$  is at most  $\gamma$ .

# Factors

Polynomial sequence  $(P_1, \dots, P_C)$   
partitions  $\mathbb{F}_2^n$  into atoms  
 $\{x \mid P_1(x) = b_1, \dots, P_C(x) = b_C\}$ .

Almost the same size

The decomposition theorem says:

$$f = \Gamma(P_1, \dots, P_C) + \Upsilon$$

The diagram shows a rectangular box, similar to the one above, partitioned into the same irregular regions. Each region is filled with a different shade of gray, ranging from light to dark. This represents the function  $\Gamma(P_1, \dots, P_C)$  applied to the partition. To the right of the box is the expression  $+ \Upsilon$ , indicating that the function  $f$  is the sum of this partitioned function and another function  $\Upsilon$ .

# What is the Gowers Norm?

## Definition

Let  $f : \mathbb{F}_2^n \rightarrow \mathbb{C}$ . The *Gowers norm of order  $d$*  for  $f$  is

$$\|f\|_{U^d} := \left( \mathbf{E}_{x, y_1, \dots, y_d} \prod_{I \subseteq \{1, \dots, d\}} J^{|I|} f\left(x + \sum_{i \in I} y_i\right) \right)^{1/2^d},$$

where  $J$  denotes complex conjugation.

- $\|f\|_{U^1} = |\mathbf{E}_x f(x)|$
- $\|f\|_{U^1} \leq \|f\|_{U^2} \leq \|f\|_{U^3} \leq \dots$
- $\|f\|_{U^d}$  measures correlation with polynomials of degree  $< d$ .

# Correlation with Polynomials of Degree $< d$

## Proposition

*For any polynomial  $P : \mathbb{F}_2^n \rightarrow \{0, 1\}$  of degree  $< d$ ,  $\|(-1)^P\|_{U^d} = 1$ .*

# Correlation with Polynomials of Degree $< d$

## Proposition

*For any polynomial  $P : \mathbb{F}_2^n \rightarrow \{0, 1\}$  of degree  $< d$ ,  $\|(-1)^P\|_{U^d} = 1$ .*

However, the converse does not hold when  $d \geq 4$ ...

# Correlation with Polynomials of Degree $< d$

## Proposition

For any polynomial  $P : \mathbb{F}_2^n \rightarrow \{0, 1\}$  of degree  $< d$ ,  $\|(-1)^P\|_{U^d} = 1$ .

However, the converse does not hold when  $d \geq 4$ ...

## Definition

$P : \mathbb{F}_2^n \rightarrow \mathbb{T}$  is a *non-classical polynomial of degree  $< d$*  if  $\|\exp(2\pi i \cdot f)\|_{U^d} = 1$ .

It turns out that the range of  $P$  is  $\mathbb{U}_{k+1} := \{0, \frac{1}{2^{k+1}}, \dots, \frac{2^{k+1}-1}{2^{k+1}}\}$  for some  $k$  (*= depth*).

# Is This Really a Constant-size Sketch?

- Structured part:  $f' = \Gamma(P_1, \dots, P_C)$ .
- $\Gamma$  indeed has a constant-size representation, but  $P_1, \dots, P_C$  may not have (even if we just want to specify the coset  $\{P \circ A\}$ ).
- The rank of  $(P_1, \dots, P_C)$  is high  
 $\Rightarrow$  Their degrees and depths determine almost everything.  
Ex. the distribution of the restriction of  $f$  to a random affine subspace.

# Regularity-Instance

Formalize “ $f$  has some specific structured part”.

## Definition

A *regularity-instance*  $I$  is a tuple of

- an error parameter  $\gamma > 0$ ,
- a structure function  $\Gamma : \prod_{i=1}^C \mathbb{U}_{h_i+1} \rightarrow [0, 1]$ ,
- a complexity parameter  $C \in \mathbb{N}$ ,
- a degree-bound parameter  $d \in \mathbb{N}$ ,
- a degree parameter  $\mathbf{d} = (d_1, \dots, d_C) \in \mathbb{N}^C$  with  $d_i < d$ ,
- a depth parameter  $\mathbf{h} = (h_1, \dots, h_C) \in \mathbb{N}^C$  with  $h_i < \frac{d_i}{p-1}$ , and
- a rank parameter  $r \in \mathbb{N}$ .

# Satisfying a Regularity-Instance

## Definition

Let  $I = (\gamma, \Gamma, C, d, \mathbf{d}, \mathbf{h}, r)$  be a regularity-instance.  
 $f$  *satisfies*  $I$  if it is of the form

$$f(x) = \Gamma(P_1(x), \dots, P_C(x)) + \Upsilon(x),$$

where

- $P_i$  is a polynomial of degree  $d_i$  and depth  $h_i$ ,
- $(P_1, \dots, P_C)$  has rank at least  $r$ ,
- $\|\Upsilon\|_{U^d} \leq \gamma$ .

# Testing the Property of Satisfying a Regularity-Instance

## Theorem

*Let  $\epsilon > 0$  and  $I = (\gamma, \Gamma, C, d, \mathbf{d}, \mathbf{h}, r)$  be a regularity-instance with  $r \geq r(\epsilon, \gamma, C, d)$ . Then, there is an  $\epsilon$ -tester for the property of satisfying  $I$  with a constant number of queries.*

# Regular-Reducibility

A property  $\mathcal{P}$  is *regular-reducible* if for any  $\delta > 0$ , there exists a set  $\mathcal{R}$  of constant number of high-rank regularity-instances with constant parameters such that:

# Our Characterization

## Theorem

*An affine-invariant property  $\mathcal{P}$  is locally testable*

*$\mathcal{P}$  is regular-reducible.*

# Proof Sketch

- Regular-reducible  $\Rightarrow$  Locally testable  
Combining the testability of regularity-instances and [HL13], we can estimate the distance to  $\mathcal{R}$ .
- Locally testable  $\Rightarrow$  Regular-reducible  
The behavior of a tester depends only on the distribution of the restriction to a random affine subspace. Since  $\Gamma$ ,  $\mathbf{d}$ , and  $\mathbf{h}$  determines the distribution, we can find  $\mathcal{R}$  using the tester.

# Testability of the Property of Satisfying a Regularity-Instance

**Input:**  $f : \mathbb{F}_2^n \rightarrow \{0, 1\}$ ,  $I = (\gamma, \Gamma, C, d, \mathbf{d}, \mathbf{h}, r)$ , and  $\epsilon > 0$ .

- 1: Set  $\delta$  small enough and  $m$  large enough.
- 2: Take a random affine embedding  $A : \mathbb{F}_2^m \rightarrow \mathbb{F}_2^n$ .
- 3: **if**  $f \circ A$  is  $\delta$ -close to satisfying  $I$  **then** accept.
- 4: **else** reject.

# Testability of the Property of Satisfying a Regularity-Instance

**Input:**  $f : \mathbb{F}_2^n \rightarrow \{0, 1\}$ ,  $I = (\gamma, \Gamma, C, d, \mathbf{d}, \mathbf{h}, r)$ , and  $\epsilon > 0$ .

- 1: Set  $\delta$  small enough and  $m$  large enough.
- 2: Take a random affine embedding  $A : \mathbb{F}_2^m \rightarrow \mathbb{F}_2^n$ .
- 3: **if**  $f \circ A$  is  $\delta$ -close to satisfying  $I$  **then** accept.
- 4: **else** reject.

Q. If  $f$  satisfies  $I$ ,  $f \circ A$  is close to  $I$ ?

Q. If  $f$  is far from  $I$ ,  $f \circ A$  is far from  $I$ ?

If  $f$  satisfies  $I$

- $f(x) = \Gamma(\mathbf{P}(x)) + \Upsilon(x)$  with  $\|\Upsilon(x)\|_{U^d} \leq \gamma$ .
- $f(Ax)$  almost satisfies  $I$ :
  - $f(Ax) = \Gamma(\mathbf{P}(Ax)) + \Upsilon(Ax)$  with  $\|\Upsilon(Ax)\|_{U^d} \leq \gamma + o(\gamma)$ .
  - $\mathbf{P}(Ax)$  meets the requirement of  $I$ .
- By perturbing  $f(Ax)$  up to  $\delta$ -fraction, we obtain a function satisfying  $I$ .

If  $f$  is  $\epsilon$ -far from  $l$

We will show that “ $f \circ A$  is  $\delta$ -close to  $l$ ” implies “ $f$  is  $\epsilon$ -close to  $l$ .”

- $\delta$ -close:  $f(Ax) \approx \Gamma(\mathbf{P}'(x))$ .
- Decomposition:  $f(x) \approx \Sigma(\mathbf{R}(x))$ .  
 $\Rightarrow f(Ax) \approx \Sigma(\mathbf{R}'(x))$ , where  $\mathbf{R}' = \mathbf{R} \circ A$ .

If  $f$  is  $\epsilon$ -far from  $l$

We will show that “ $f \circ A$  is  $\delta$ -close to  $l$ ” implies “ $f$  is  $\epsilon$ -close to  $l$ .”

- $\delta$ -close:  $f(Ax) \approx \Gamma(\mathbf{P}'(x))$ .
- Decomposition:  $f(x) \approx \Sigma(\mathbf{R}(x))$ .  
 $\Rightarrow f(Ax) \approx \Sigma(\mathbf{R}'(x))$ , where  $\mathbf{R}' = \mathbf{R} \circ A$ .

$$\Sigma(\mathbf{R}'(x)) \approx \Gamma(\mathbf{P}'(x)).$$

If  $f$  is  $\epsilon$ -far from  $l$

We will show that “ $f \circ A$  is  $\delta$ -close to  $l$ ” implies “ $f$  is  $\epsilon$ -close to  $l$ .”

- $\delta$ -close:  $f(Ax) \approx \Gamma(\mathbf{P}'(x))$ .
- Decomposition:  $f(x) \approx \Sigma(\mathbf{R}(x))$ .  
 $\Rightarrow f(Ax) \approx \Sigma(\mathbf{R}'(x))$ , where  $\mathbf{R}' = \mathbf{R} \circ A$ .

$$\Sigma(\mathbf{R}'(x)) \approx \Gamma(\mathbf{P}'(x)).$$

We can find an extension  $\overline{\mathbf{R}'}$  of  $\mathbf{R}'$  (of high rank) such that:

$$P_i = \Gamma_i(\overline{\mathbf{R}'}(x)) \text{ for some } \Gamma_i.$$

$$\Rightarrow \Sigma(\mathbf{R}'(x)) \approx \Gamma(\Gamma_1(\overline{\mathbf{R}'}(x)), \dots, \Gamma_C(\overline{\mathbf{R}'}(x))).$$

If  $f$  is  $\epsilon$ -far from  $l$

### Lemma

*The identity holds for every value in the range of  $\overline{\mathbf{R}}'$ .*

If  $f$  is  $\epsilon$ -far from  $l$

### Lemma

*The identity holds for every value in the range of  $\overline{\mathbf{R}}'$ .*

We can replace  $\overline{\mathbf{R}}'$  (on  $m$  variables) by a polynomial sequence  $\overline{\mathbf{R}}$  on  $n$  variables such that  $\overline{\mathbf{R}} \circ A = \overline{\mathbf{R}}'$ .

$$\Rightarrow f(x) \approx \Sigma(\mathbf{R}(x)) \approx \Gamma(\Gamma_1(\overline{\mathbf{R}}(x)), \dots, \Gamma_c(\overline{\mathbf{R}}(x))) := \Gamma(\mathbf{P}(x)).$$

If  $f$  is  $\epsilon$ -far from  $l$

### Lemma

*The identity holds for every value in the range of  $\overline{\mathbf{R}}'$ .*

We can replace  $\overline{\mathbf{R}}'$  (on  $m$  variables) by a polynomial sequence  $\overline{\mathbf{R}}$  on  $n$  variables such that  $\overline{\mathbf{R}} \circ A = \overline{\mathbf{R}}'$ .

$$\Rightarrow f(x) \approx \Sigma(\mathbf{R}(x)) \approx \Gamma(\Gamma_1(\overline{\mathbf{R}}(x)), \dots, \Gamma_c(\overline{\mathbf{R}}(x))) := \Gamma(\mathbf{P}(x)).$$

### Lemma

*With high probability  $\mathbf{P}(x)$  is consistent with  $l$ .*

$\Rightarrow f$  is  $\epsilon$ -close to satisfying  $l$ .

$\Rightarrow$  Contradiction.

# Conclusions

- Easily extendable to  $\mathbb{F}_p$  for a prime  $p$ .
- Query complexity is actually unknown due to the Gowers inverse theorem. Other parts involve Ackermann-like functions.

# Conclusions

- Easily extendable to  $\mathbb{F}_p$  for a prime  $p$ .
- Query complexity is actually unknown due to the Gowers inverse theorem. Other parts involve Ackermann-like functions.  
 $\Rightarrow$  Obtaining a tower-like function is a big improvement!

# Open Problems

- Characterization based on function (ultra)limits?
- locally testable with one-sided error  $\Leftrightarrow$  affine-subspace hereditary? [BFH<sup>+</sup>13]
- Characterization of linear-invariant properties?
- Study other groups?
  - Abelian  $\Rightarrow$  higher order Fourier analysis developed [Sze12].
  - Non-Abelian  $\Rightarrow$  representation theory?
- Why is affine invariance easier to deal with than permutation invariance?
