128. Zvi Artstein, **Interval-decomposability of continuous functions, and convexity.** J. Convex Analysis 27 (2020), 31-48.

Abstract. A generalization of the notion of a decomposable set of functions is offered. It applies, in particular, to continuous functions which are not differentiable. Following the classical analysis of decomposable families of integrable functions, it is shown that many convex analysis features hold also in the general framework.
